

A Characteristic Optical Variability Time Scale in Astrophysical Accretion Disks

(Burke et al. 2021)

Yunjing Wu
09.24.2021

Content

1. AGN accretion disk model and τ_{damping}
2. Physical explanation of τ_{damping} ?
3. Comments on the M_{BH} vs. τ_{damping} relation
4. Summary

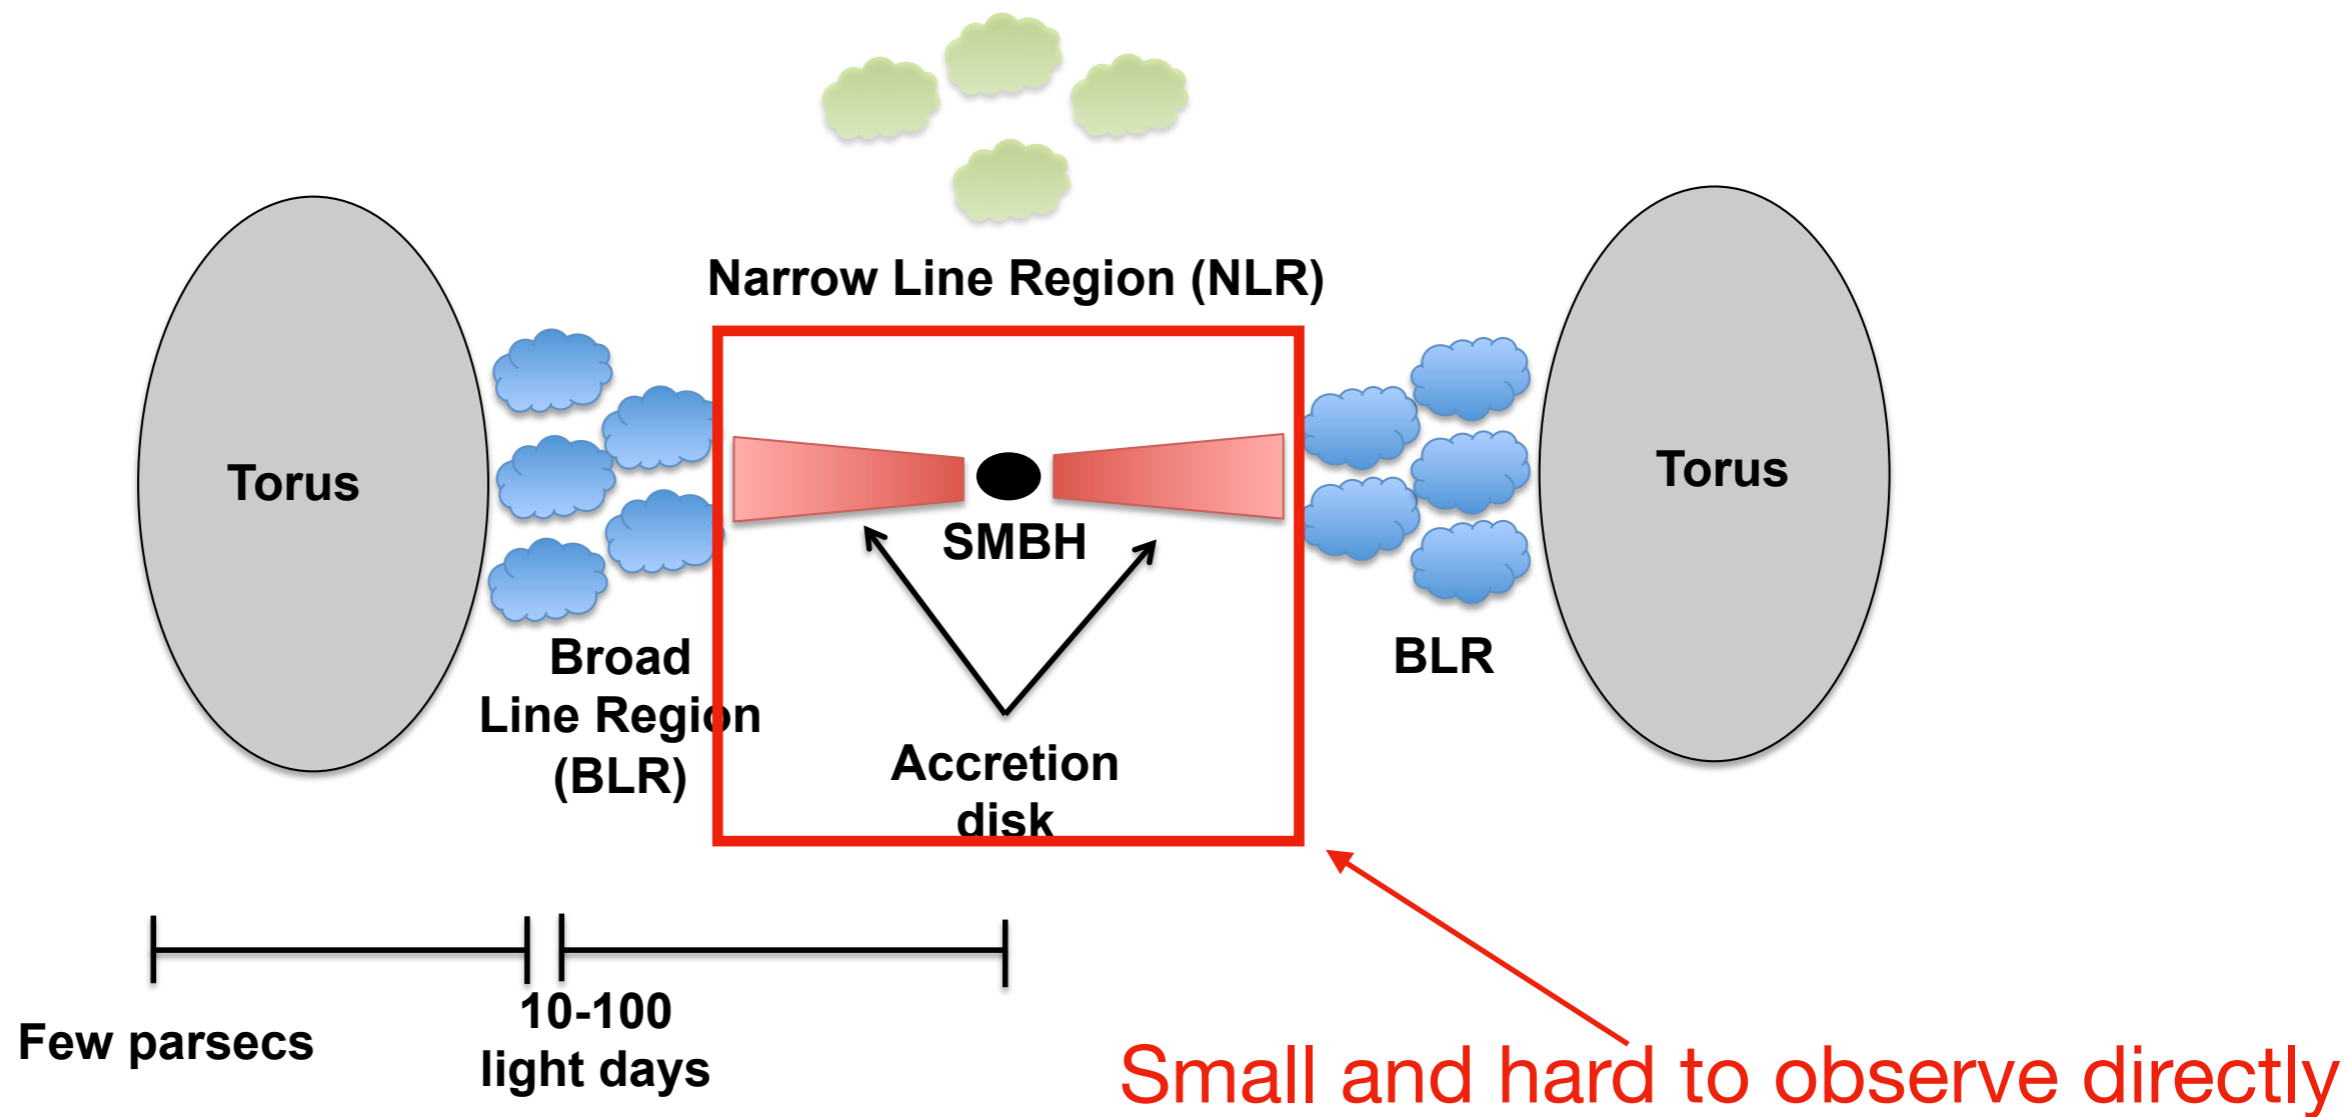

Active Galactic Nuclei (AGN)

Active Galactic Nuclei (AGN)

Active Galactic Nuclei (AGN)

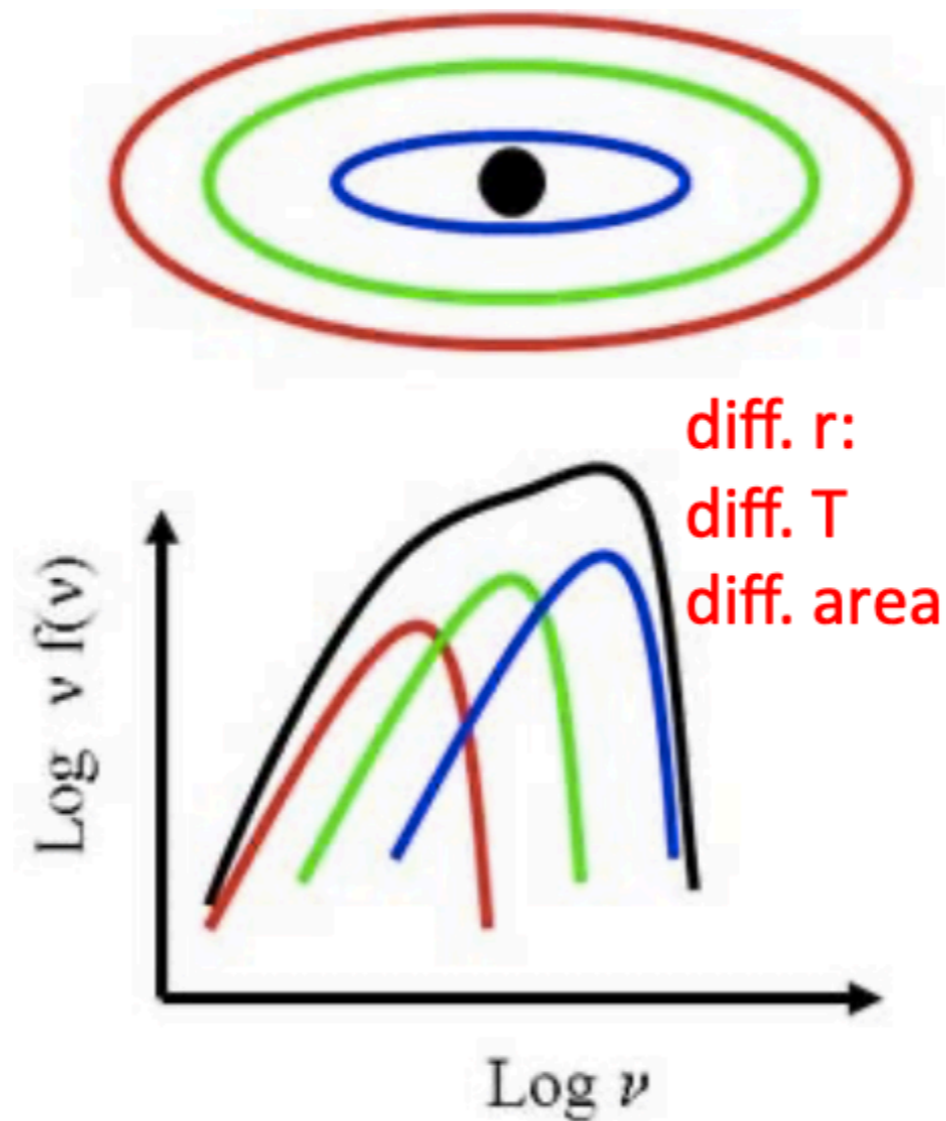

Accretion disc emission mostly at optical range

(Padovani+ 2018)

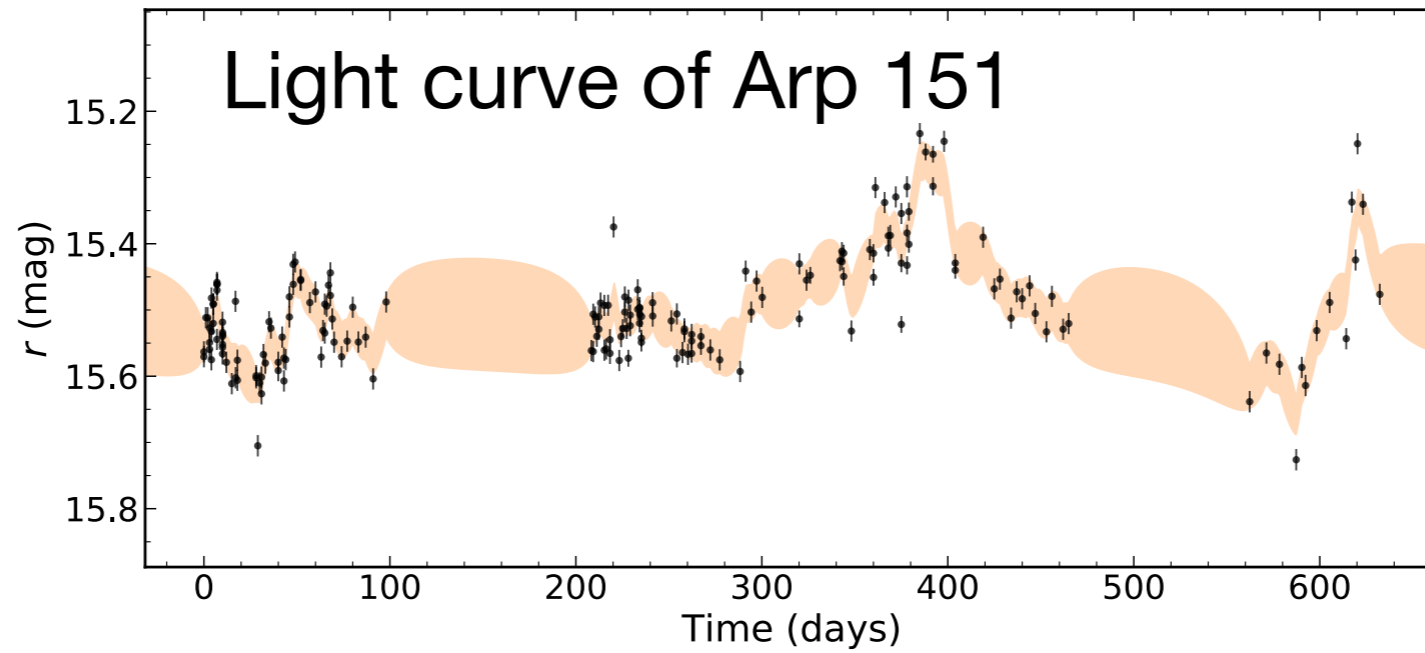

Multi-black body model

(Shakura+ 1973)

Damped random walk & AGN Continuum variability

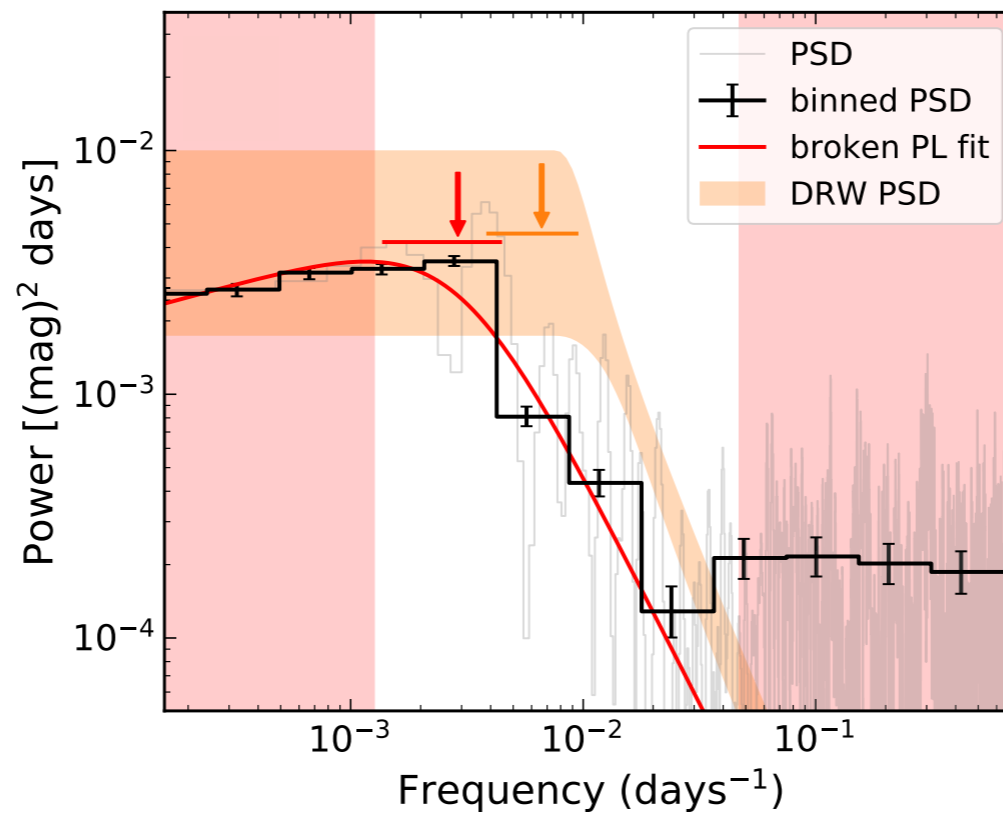

Damped random walk & AGN Continuum variability

Damped random walk & AGN Continuum variability

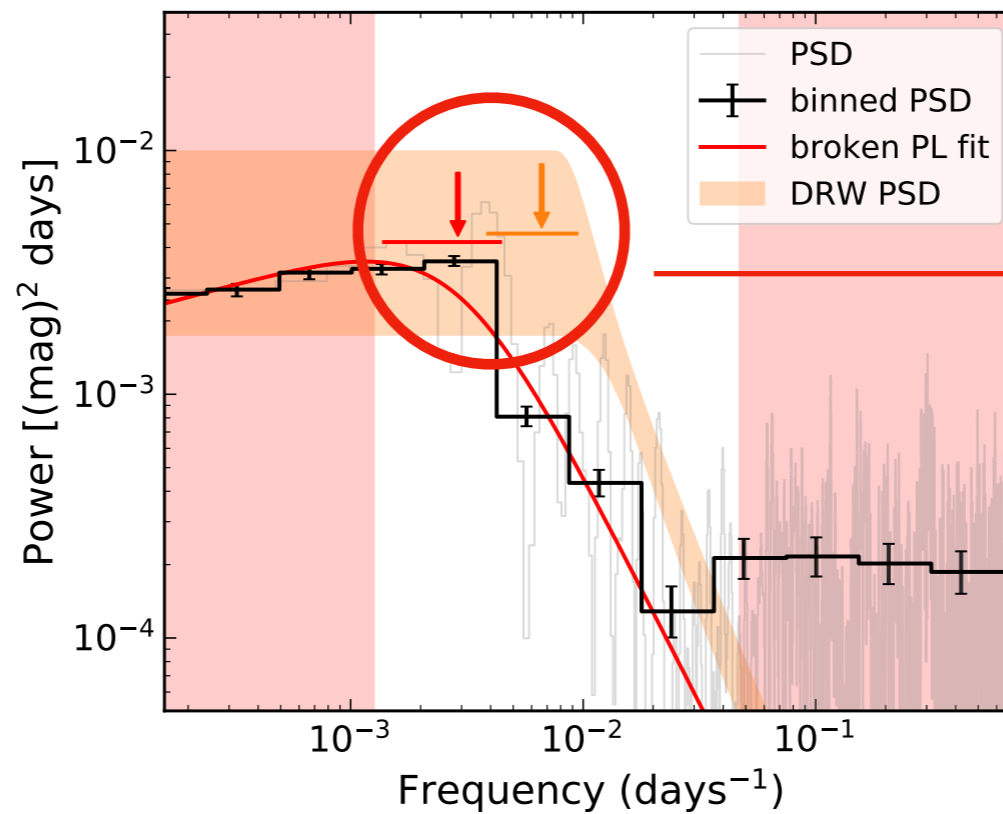

DRW can describe AGN continuum variability

Damped random walk & AGN Continuum variability

DRW can describe AGN continuum variability

Content

1. AGN accretion disk model and τ_{damping}

2. Physical explanation of τ_{damping} ?

3. Comments on the M_{BH} vs. τ_{damping} relation

4. Summary

Content

1. AGN accretion disk model and τ_{damping}

2. Physical explanation of $\tau_{\text{damping}}?$

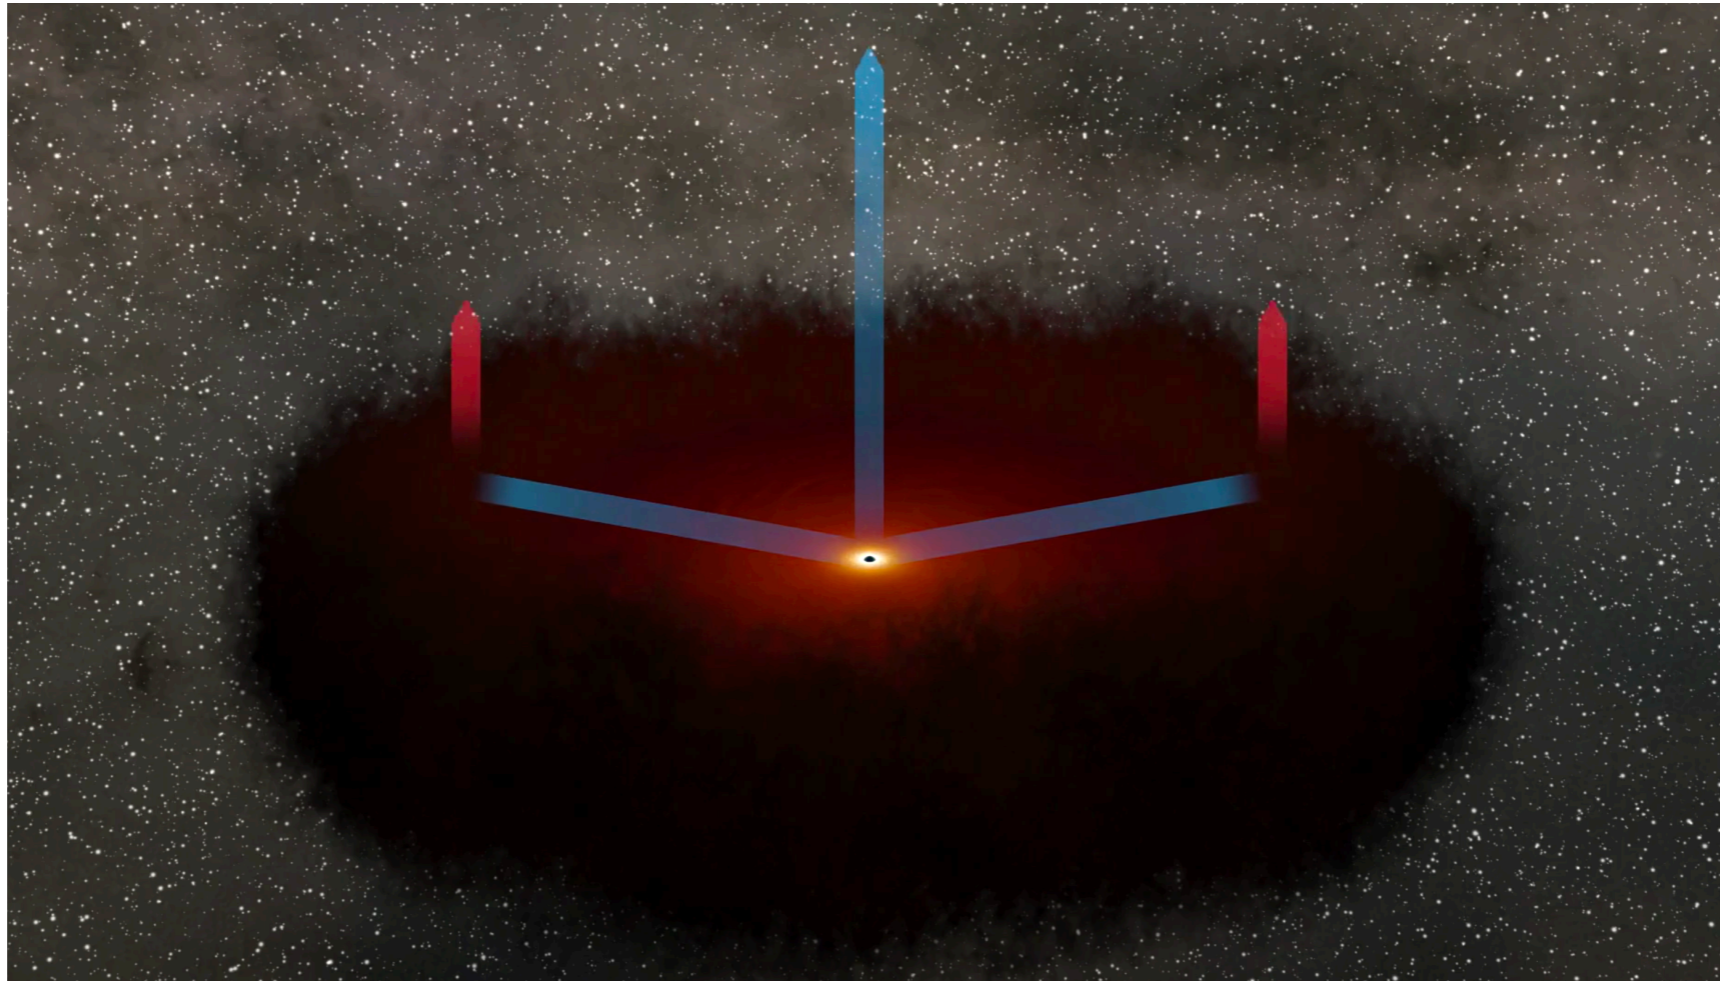

3. Comments on the M_{BH} vs. τ_{damping} relation

4. Summary

AGN M_{BH} measurements

1. reverberation mapping

$$M_{\text{BH}} = frv^2/G$$

r is the distance between Broad line region and BH.

v is the velocity of the sounding gas.

AGN M_{BH} measurements

2. Single exposure constrains

$$\log \frac{M_{\text{BH}}}{M_{\odot}} = a + b \log \frac{L}{10^{44} \text{ erg s}^{-1}} + c \log \frac{W}{\text{km s}^{-1}}$$

L represents line luminosity ($\text{H}\alpha$, CIV, MgII).

W represents the corresponding line width.

AGN M_{BH} measurements

2. Single exposure constrains

$$\log \frac{M_{\text{BH}}}{M_{\odot}} = a + b \log \frac{L}{10^{44} \text{ erg s}^{-1}} + c \log \frac{W}{\text{km s}^{-1}}$$

L represents line luminosity ($\text{H}\alpha$, CIV, MgII).

W represents the corresponding line width.

These two methods need spectroscopic observations.

AGN M_{BH} measurements

2. Single exposure constrains

$$\log \frac{M_{\text{BH}}}{M_{\odot}} = a + b \log \frac{L}{10^{44} \text{ erg s}^{-1}} + c \log \frac{W}{\text{km s}^{-1}}$$

L represents line luminosity ($\text{H}\alpha$, CIV, MgII).

W represents the corresponding line width.

These two methods need spectroscopic observations.

If not...

M_{BH} vs. τ_{damping} relation

67 AGNs with long timescale light curve observations
and accurate M_{BH} measurements

M_{BH} vs. τ_{damping} relation

67 AGNs with long timescale light curve observations
and accurate M_{BH} measurements

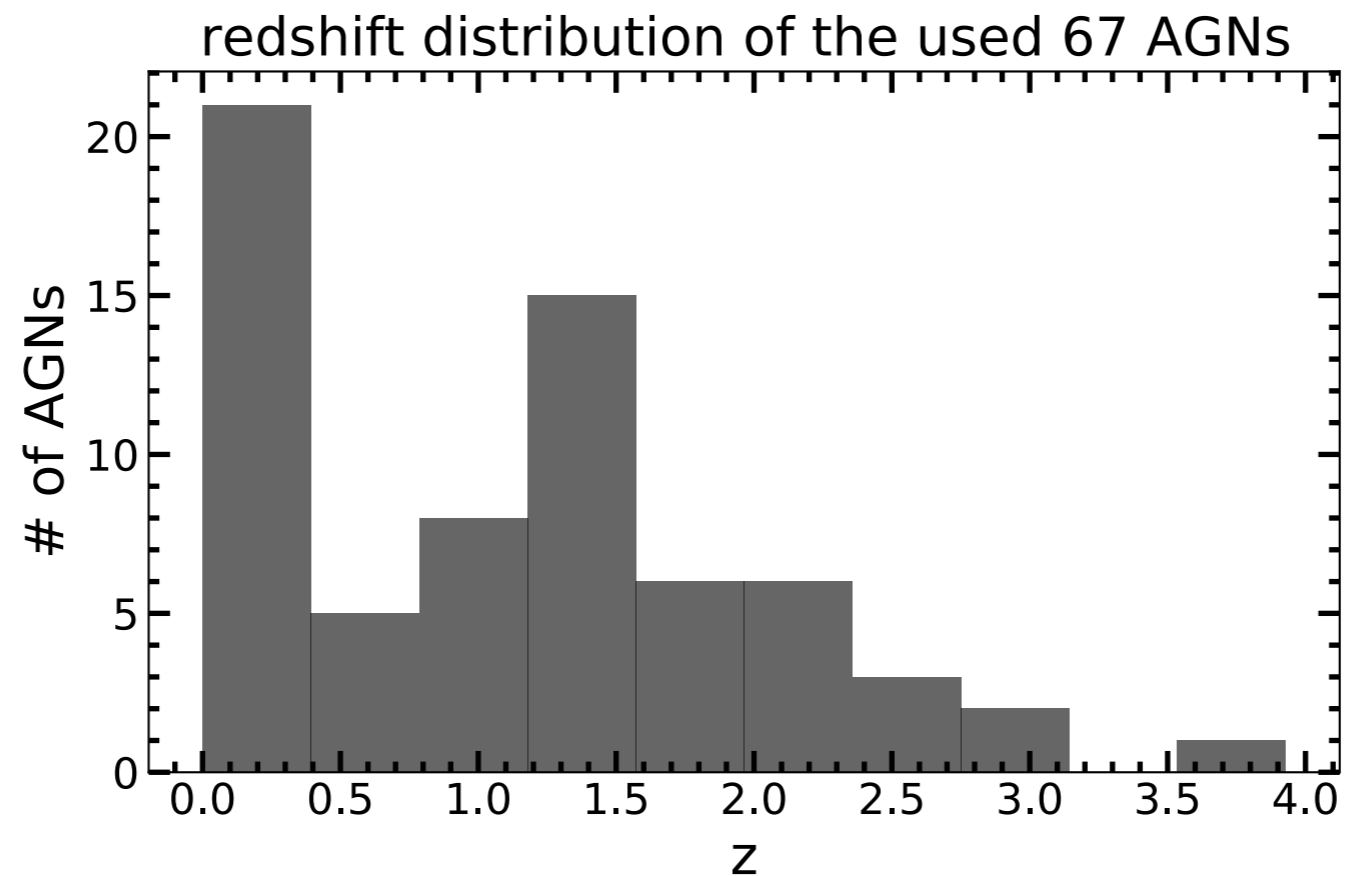

Photometric observations can drive M_{BH} directly

Content

1. AGN accretion disk model and τ_{damping}
2. Physical explanation of τ_{damping} ?
3. Comments on the M_{BH} vs. τ_{damping} relation
4. Summary

Comment 1

The redshift of the used 67 QSOs ranges from 0 to 4.
Will these AGNs have redshift evolution?

Comment 2

The derived M_{BH} are based on two methods. How consistent are these two mass conversion relations?

Comment 2

The derived M_{BH} are based on two methods. How consistent are these two mass conversion relations?

The data points at the low mass end are very limited. At the high mass end, the $M_{\text{BH}} - \tau_{\text{damping}}$ relation is not retained.

Content

1. AGN accretion disk model and τ_{damping}
2. Physical explanation of τ_{damping} ?
3. Comments on the M_{BH} vs. τ_{damping} relation
4. Summary

Summary (take-home message)

Introduction: DRW model can be used to describe the variability of the AGN continuum. (τ_{damping})

Summary (take-home message)

Introduction: DRW model can be used to describe the variability of the AGN continuum. (τ_{damping})

Method: RM and SE both need spectroscopic observations to measure the M_{BH} .

Summary (take-home message)

Introduction: DRW model can be used to describe the variability of the AGN continuum. (τ_{damping})

Method: RM and SE both need spectroscopic observations to measure the M_{BH} .

Updates: relation between M_{BH} & τ_{damping} . Photometric observations may be an alternative and directly way to measure the M_{BH} .

Updates: relation between M_{BH} & τ_{damping} . Photometric observations may be an alternative and directly way to measure the M_{BH} .

Questions

1. Why can they build up this relation rather than previous ones?
2. How solid is this relation?
3. Could future surveys further confirm this relation?
4. Physics behind τ_{damping} ?
