3. **What is ForkEoR?**
4. **The performance of ForkEoR**
5. **What' s next?**

21-Centimeter
Cosmology Explained

After the Big Bang, the universe fills with ionized hydrogen, single positive protons.

As the universe expands, hydrogen clouds cool off. Positive protons combine with negative electrons to create neutral hydrogen. The atoms can shift between two energy states.

Due to ultraviolet radiation from the first stars, neutral hydrogen atoms lose their electrons and become positively charged again.

Radio telescopes detect the 21cm emissions, now stretched out by the universe's expansion. Whenever they no longer appear, the first stars have formed.

SKA1-low Configuration (Boolardy, Aus.)

SKA1-low

the SKA's low-frequency instrument

Location: Australia

Frequency range:
50 MHz
to
350 MHz

~131,000
antennas spread between
512 stations

Maximum baseline:
~65km

SKA1-Low
Antenna/Receptor

Antenna Beam

Correlation and
Tied-array Beams

How to remove foreground?

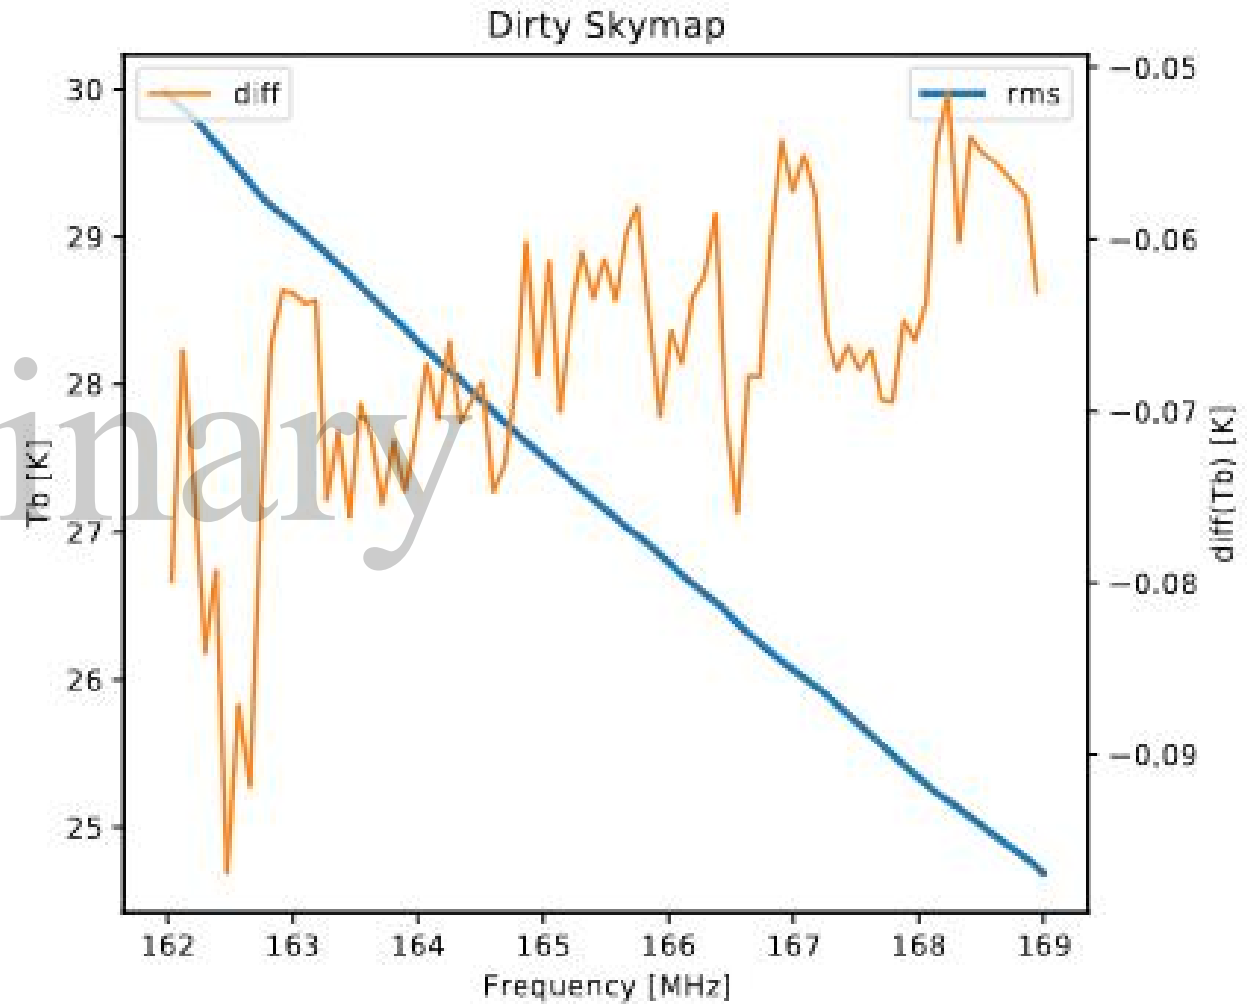

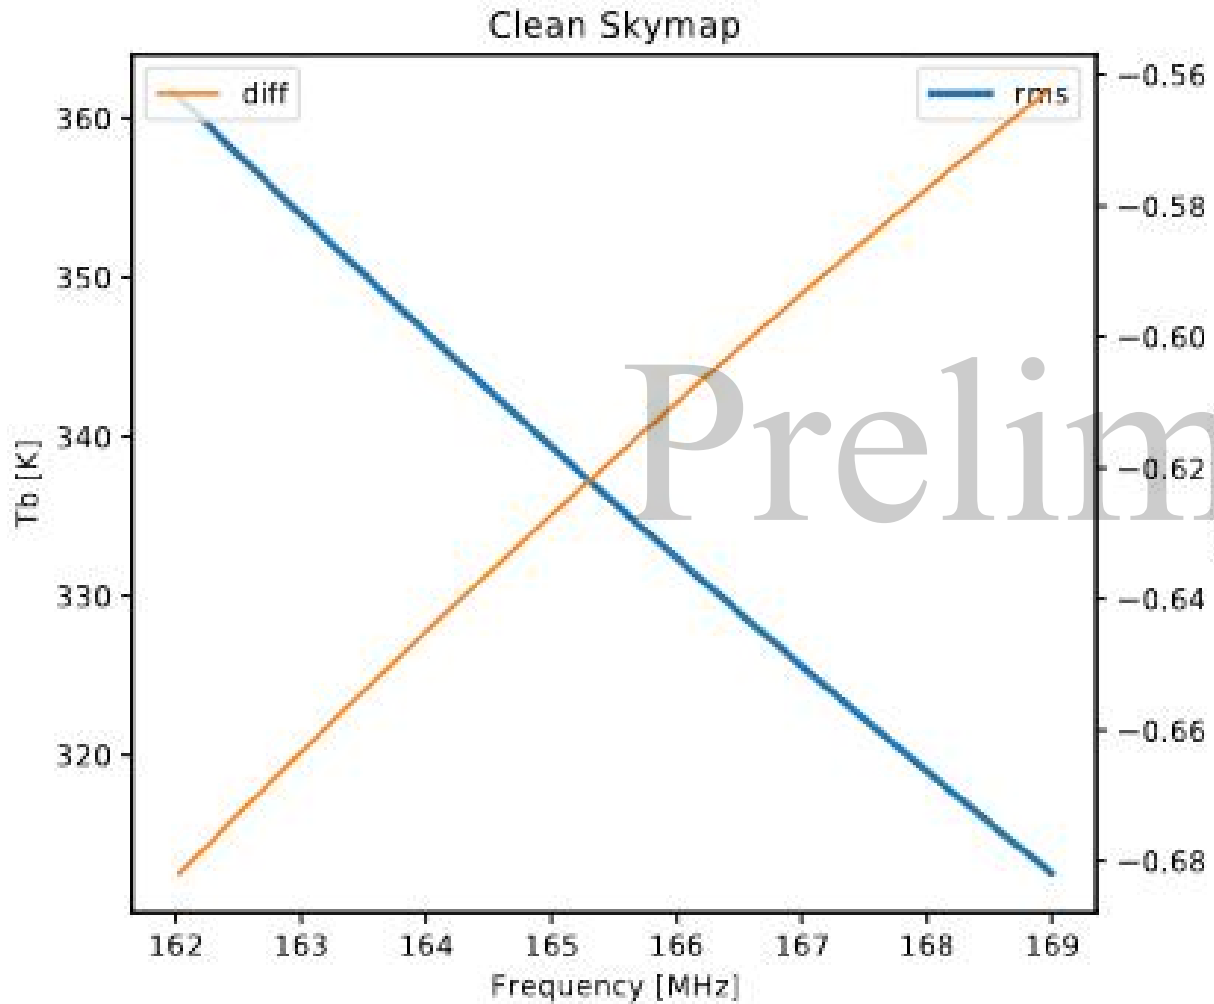

1. Foreground is smooth in frequency
2. 21cm signal is fluctuating
3. Pick out the fluctuating signal from smooth signal

Complex PSF comes from the incomplete coverage in uv space

Skymap convolved by the PSF = non-smooth foreground

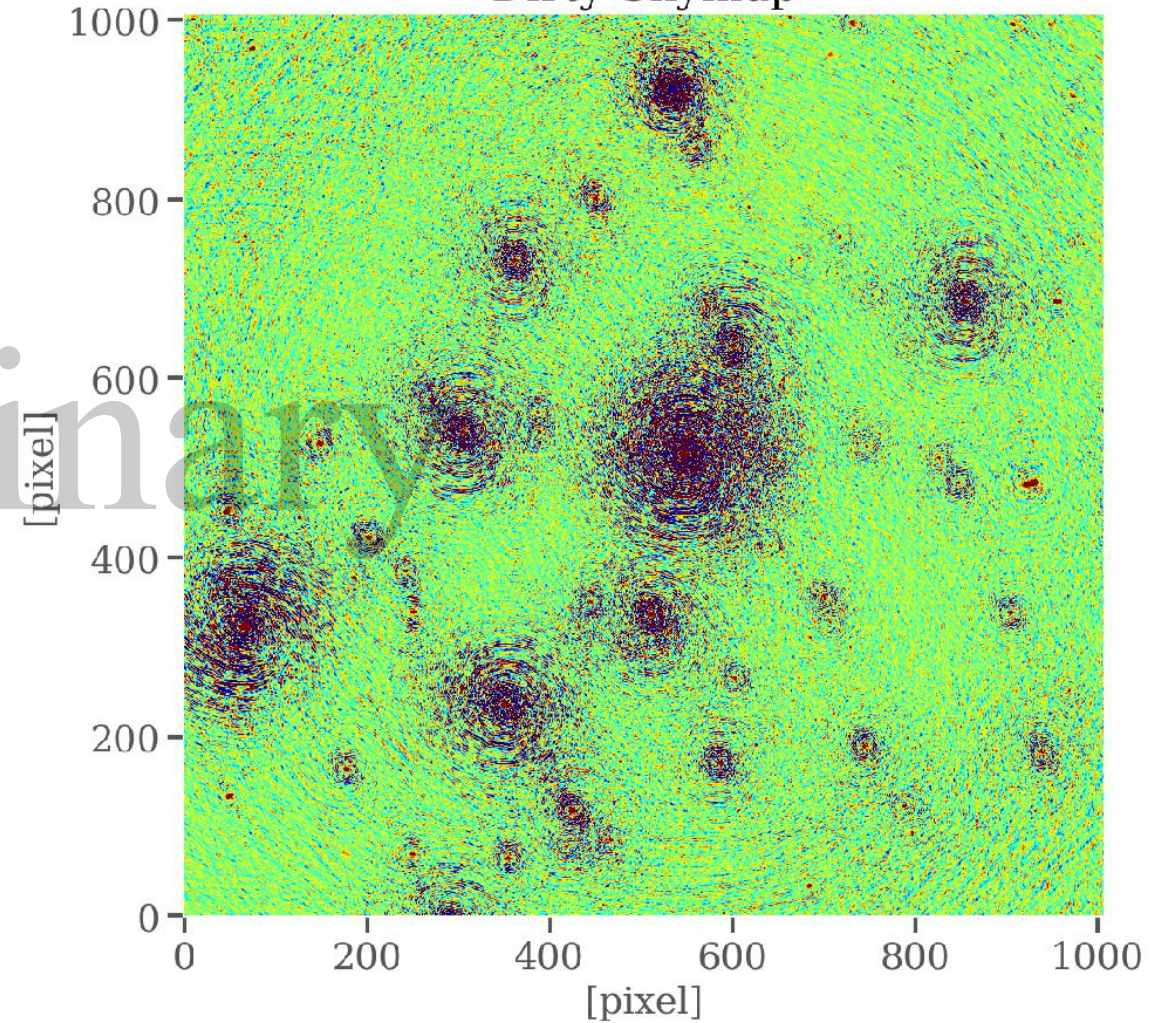

Bright point sources need to be treated before training

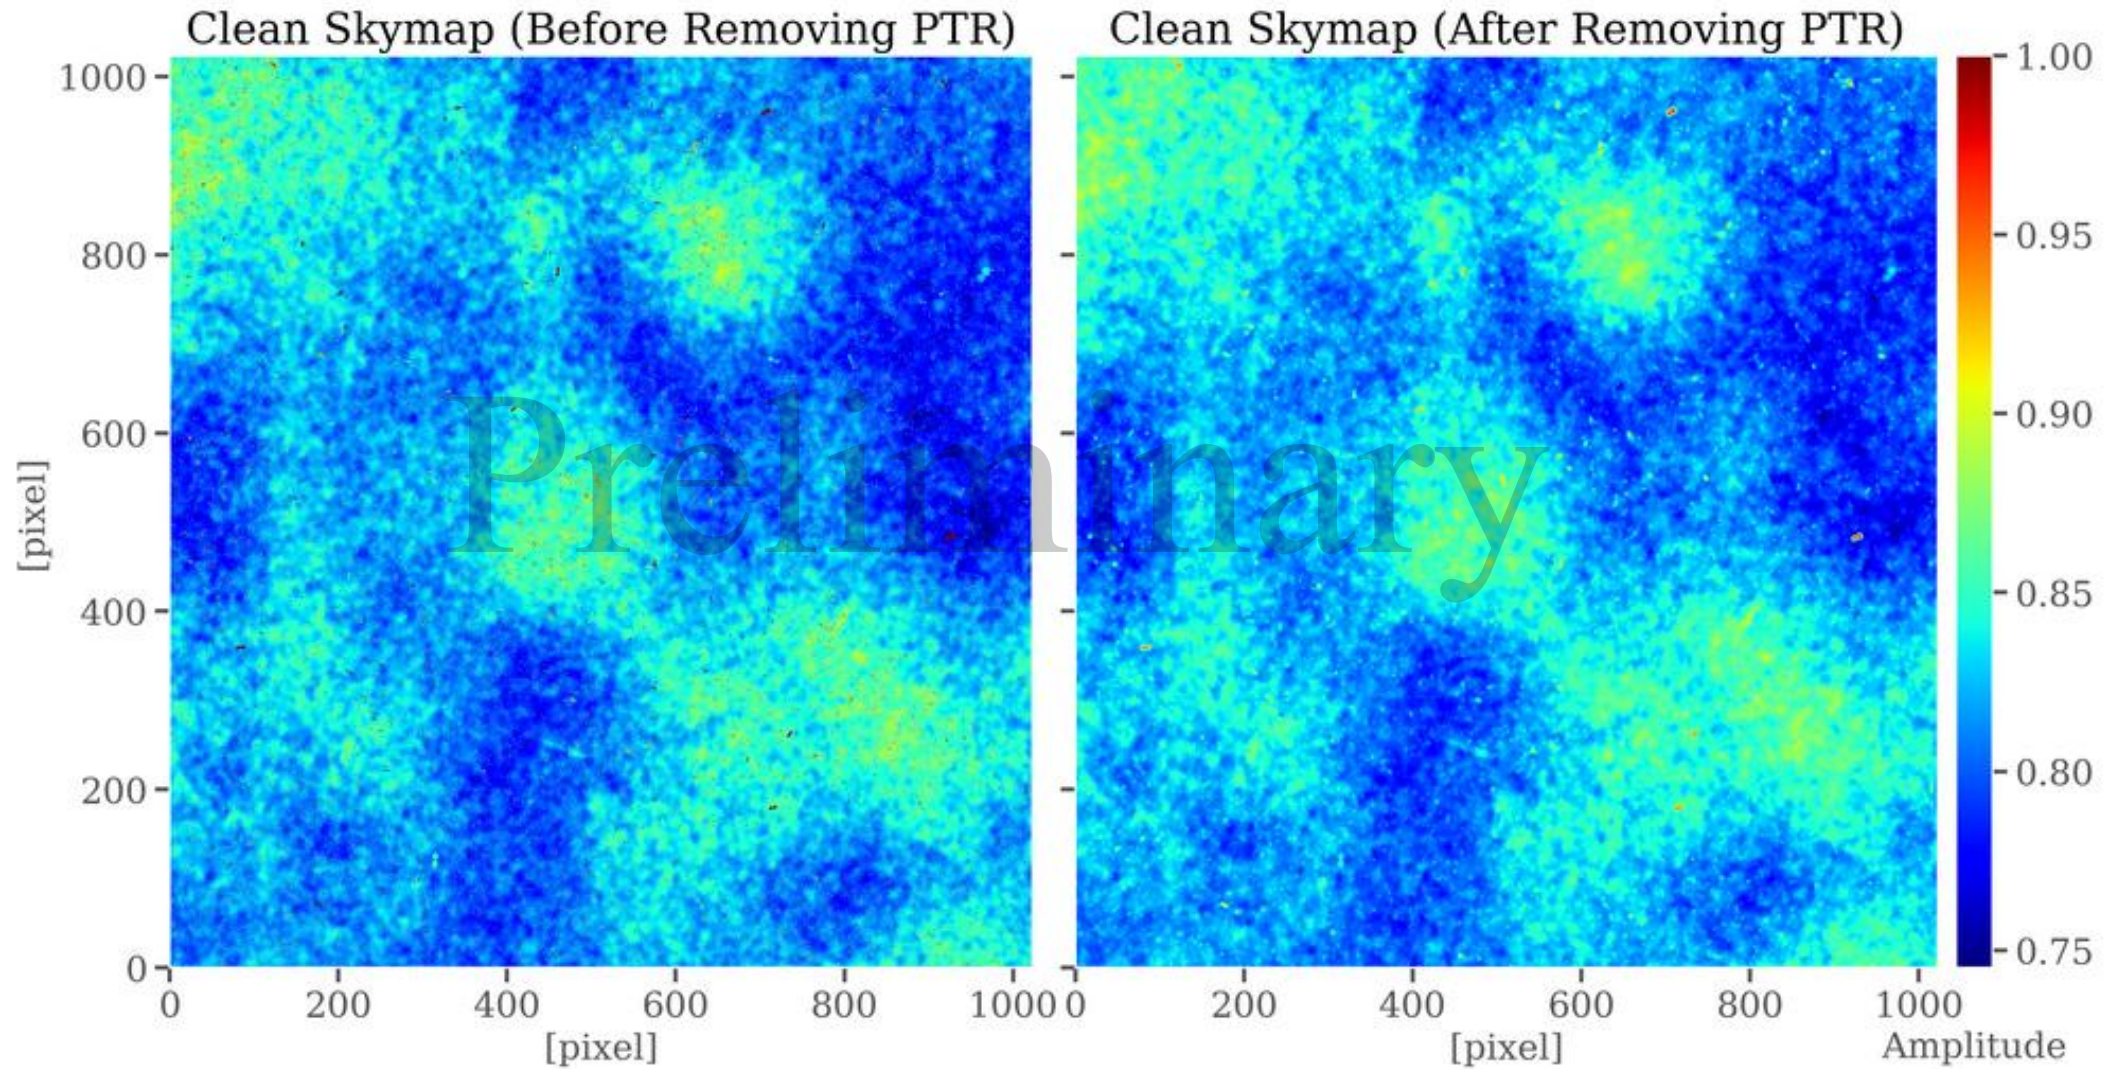

Clean Skymap (Before Removing PTR)

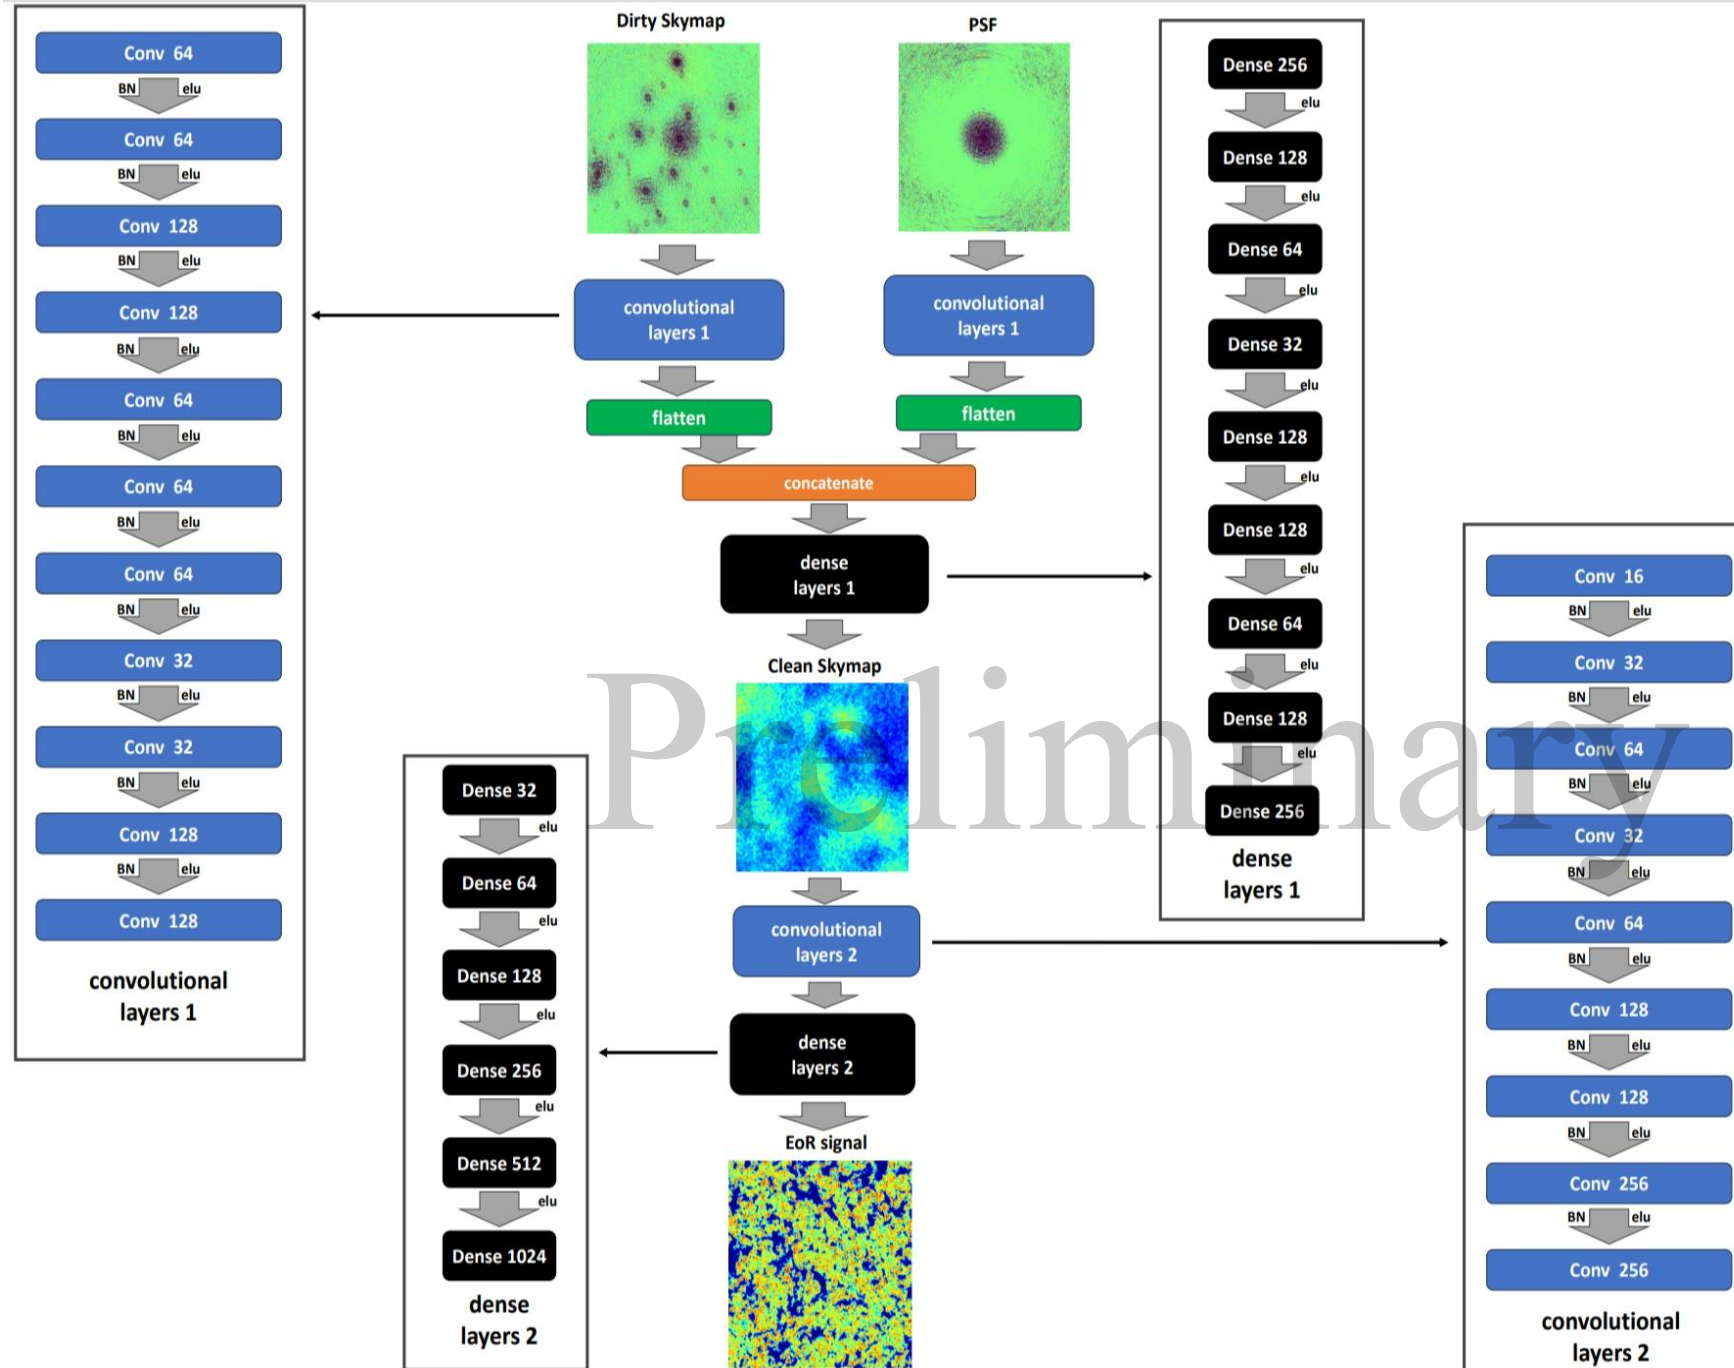

Dirty Skymap

Remove top 1% bright pixels and gaussian smoothing

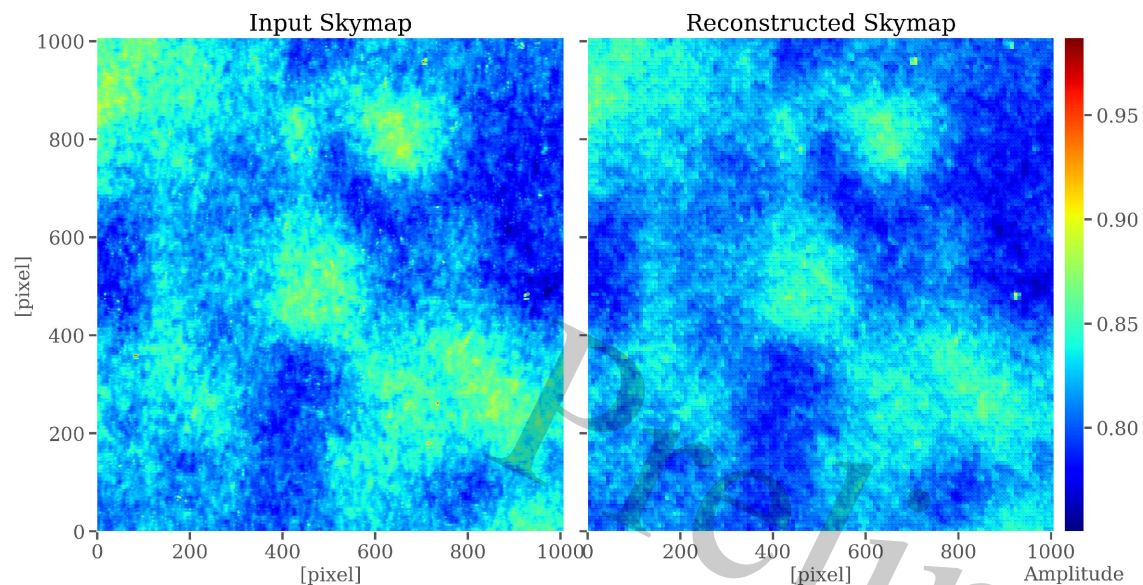

ForkEoR

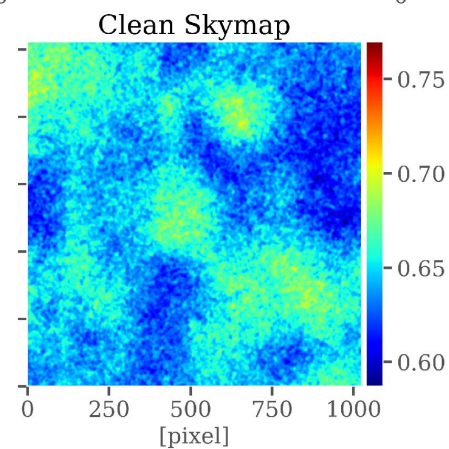

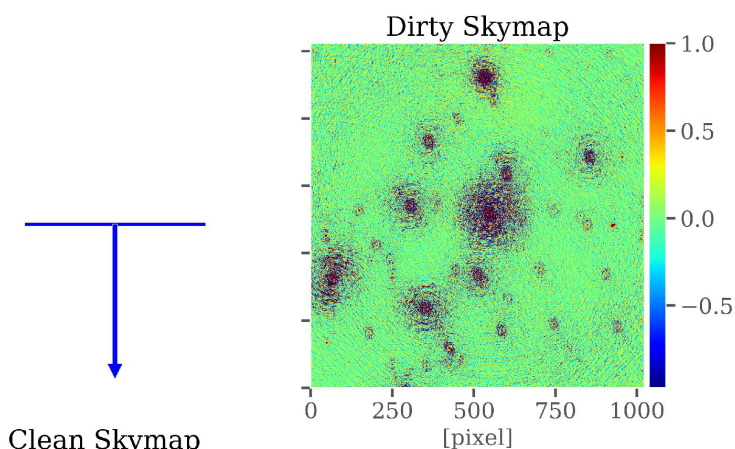

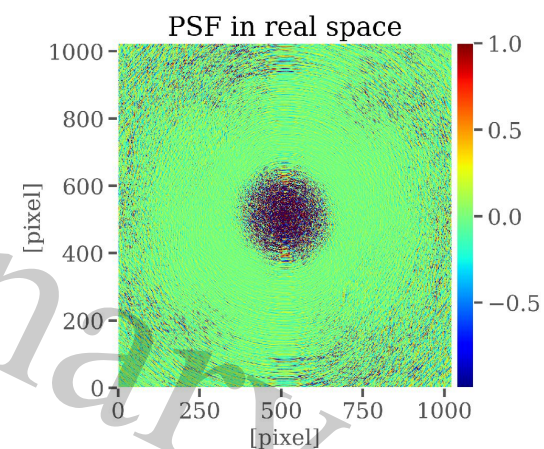

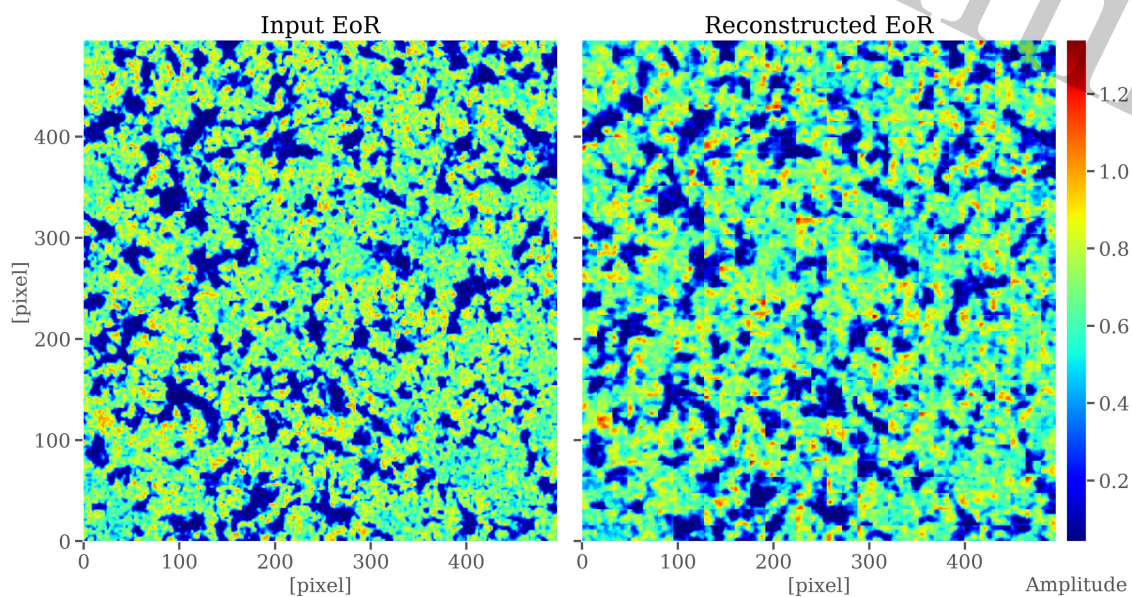

1. Fork like CNN

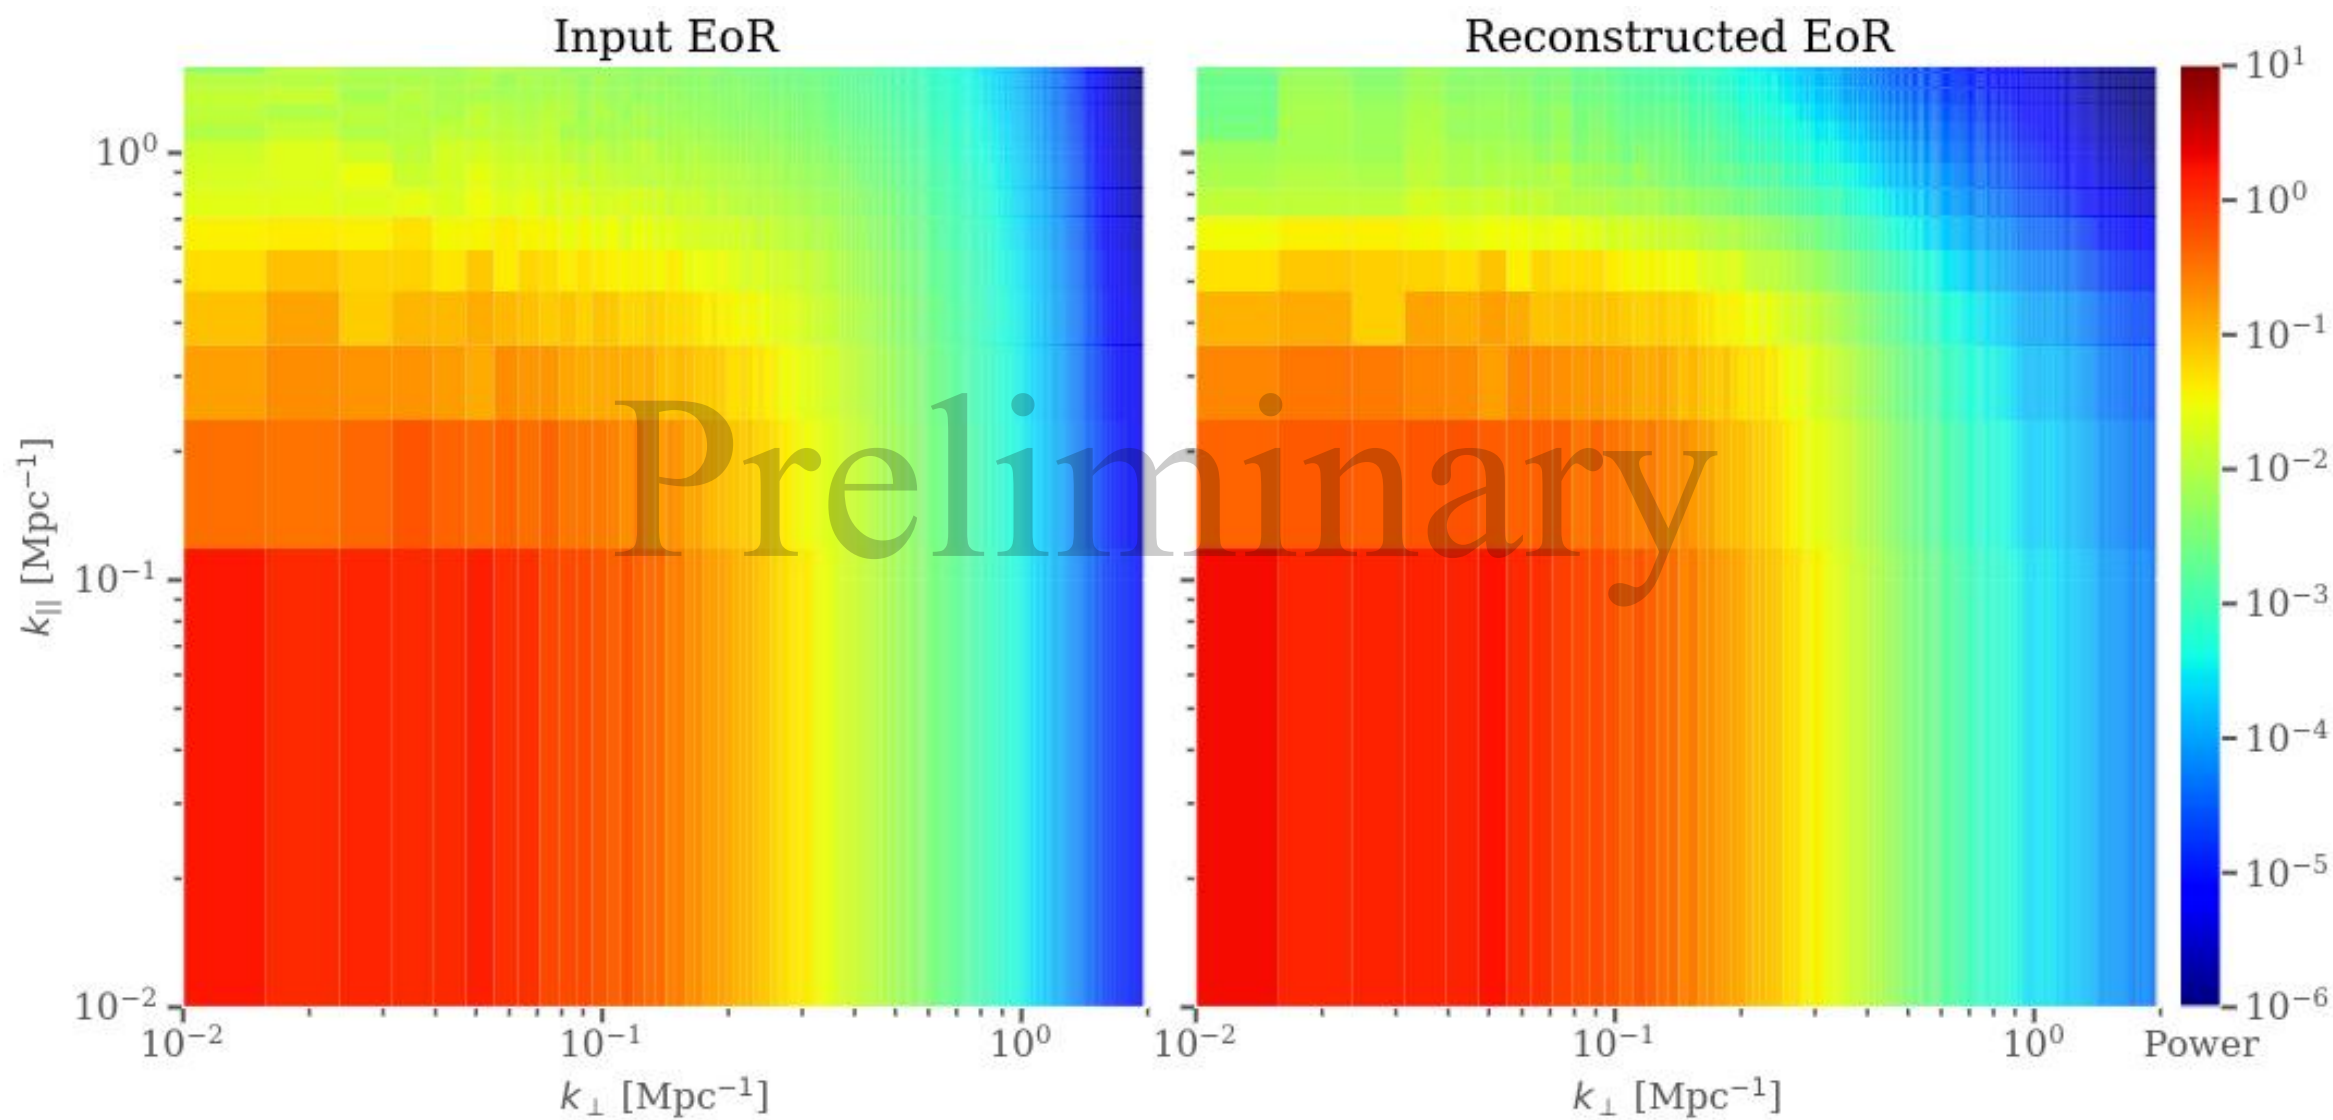

2. CNN foreground removal

3. training and testing

The performance of
ForkEoR
Deconvolution: 97%
EoR Reconstruction: 92%

What's next?

1. check the overfitting possibility
2. more training, validating and testing sample
3. better End-to-End simulation
4. parallelize ForkEoR for faster training
5. further optimize the parameters of the structure
6. testing correctness by applying to SDC3a data and test robustness with multiple PSFs

What is AI's view of the universe?
